HW 4

As a group, we started to think how to use the PUMA codes to look closely at specific areas like ownership, housing cost, income, and race. The results were interesting in what R studio produced but it was a little challenging to break down some of the information since New York City is a big city. It could be an unfair comparison specifically in income because the city is a very expense place to live despite your educational background. But can be difficult depending on how expensive the neighbor would cost to rent versus to own, etc. R shows interesting results for this comparison.
